

# 100V Input, 0.6A, Ultra-Low $I_Q$ , Synchronous Buck Converter

## 1. Description

The MK9016 operates over a wide input voltage range from 5V to 100V. With integrated the main MOSFET and a synchronous MOSFET, the MK9016 delivers up to 0.6A output current.

The MK9016 adopts a constant on-time (COT) control architecture to achieve excellent transient response.

With patented standby circuits, the device can achieve ultra-low  $I_Q$ , and exit the standby mode fast.

## 2. Applications

- BMS (E-Bike, Electric Tools)
- Automotive and Industry Systems
- Motor Drives, Telecom

## 3. Features

- Wide Input Voltage 5V-100V
- 0.6A Output Current Capability
- Low  $R_{DS(ON)}$  for Internal MOSFETS 750m $\Omega$ /300m $\Omega$
- <100 $\mu$ A Supply Current under  $I_{LOAD}=100\mu$ A
- MK9016FAD Adjustable FSW up to 1MHz
- Internal 3ms Soft-start
- Smart power saving and ultra-Fast Transient Response
- Precision  $\pm 1\%$  Feedback Reference
- Open-Drain Power Good Indicator
- OC, OT Protection with Hiccup Mode
- No Loop Compensation Components
- ESOP8 Package with Thermal PAD

## 4. Typical Application

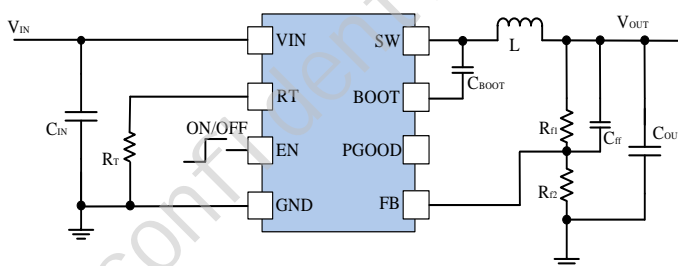

Figure 1. Typical Application Diagram

Figure 2. Efficiency at 12Vout

## 5. Package Reference and Pin Function

**ESOP8( top view)**

Order No.	Description
MK9016FAD	ESOP-8, tape, 4k/reel

Pin #	Name	Description
1	GND	Ground pin.
2	VIN	Input pin. Decouple this pin to GND with a low ESR ceramic capacitor.
e3	EN	Enable control pin. The device has accurate 1.17V rising threshold and a programable falling threshold. This pin also can be used for programming the VIN turn on voltage with the resistor divider.
4	RT	On-time programming pin. A resistor between this pin and GND sets the buck switch on-time. $F_{SW}(kHz) = \frac{3.2 \times V_{out}(V)}{R_T(M\Omega)}$
5	FB	Output feedback pin. Connect this pin to the center point of the output resistor divider to program the output voltage: $V_{OUT} = 1.2 \times (1 + R_{f1}/R_{f2})$
6	PGOOD	Power good indicator pin. This pin is an open-drain output pin. Connect to a source voltage through an pull-up resistor.
7	BOOT	Boot-strap pin. Decouple this pin to SW pin with a 10nF ceramic capacitor.
8	SW	Inductor pin. Connect to the switch node of the power inductor.
EP	Thermal PAD	Exposed pad of the package. Solder the EP to the GND pin and connect to a large copper plane to reduce thermal resistance.

## 6. Absolute Maximum Ratings <sup>(1)</sup>

VIN, EN, SW to GND.....	-0.3V to 110V
SW to GND (20ns pulse).....	-3V to 110V
BOOT to GND.....	SW+6.6V
RT to GND.....	-0.3V to 6.6V
FB to GND.....	-0.3V to 6.6V
PGOOD to GND.....	-0.3V to 30V
Power Dissipation, P <sub>D</sub> @T <sub>A</sub> =25°C, ESOP8.....	3.3W
Package Thermal Resistance	
$\theta_{JA}$ (Junction to ambient).....	30°C/W
$\theta_{JC}$ (Junction to case).....	10°C/W
Operating Junction Temperature, T <sub>J</sub> .....	-40°C to 160°C
Storage Temperature, T <sub>stg</sub> .....	-65°C to 160°C
Soldering Temperature(10 second), T <sub>sld</sub> .....	260°C

### Note:

- (1) Stresses beyond the “ABSOLUTE MAXIMUM RATINGS” may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated in “RECOMMENDED OPERATING CONDITIONS”. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## 7. Recommended Operating Conditions

VIN Voltage.....	5V to 100V
EN Voltage.....	-0.3V to 100V
SW Voltage.....	-0.3V to 100V
Operating Junction Temperature.....	-40°C to 125°C

## 8. ESD Ratings

		Value	Units
Electrostatic discharge V <sub>ESD</sub>	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, SW, BOOT, EN, RT, FB, PGOOD <sup>(1)</sup> .	±2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, SW, BOOT, EN, RT, FB, PGOOD <sup>(2)</sup> .	±500	V

### Notes:

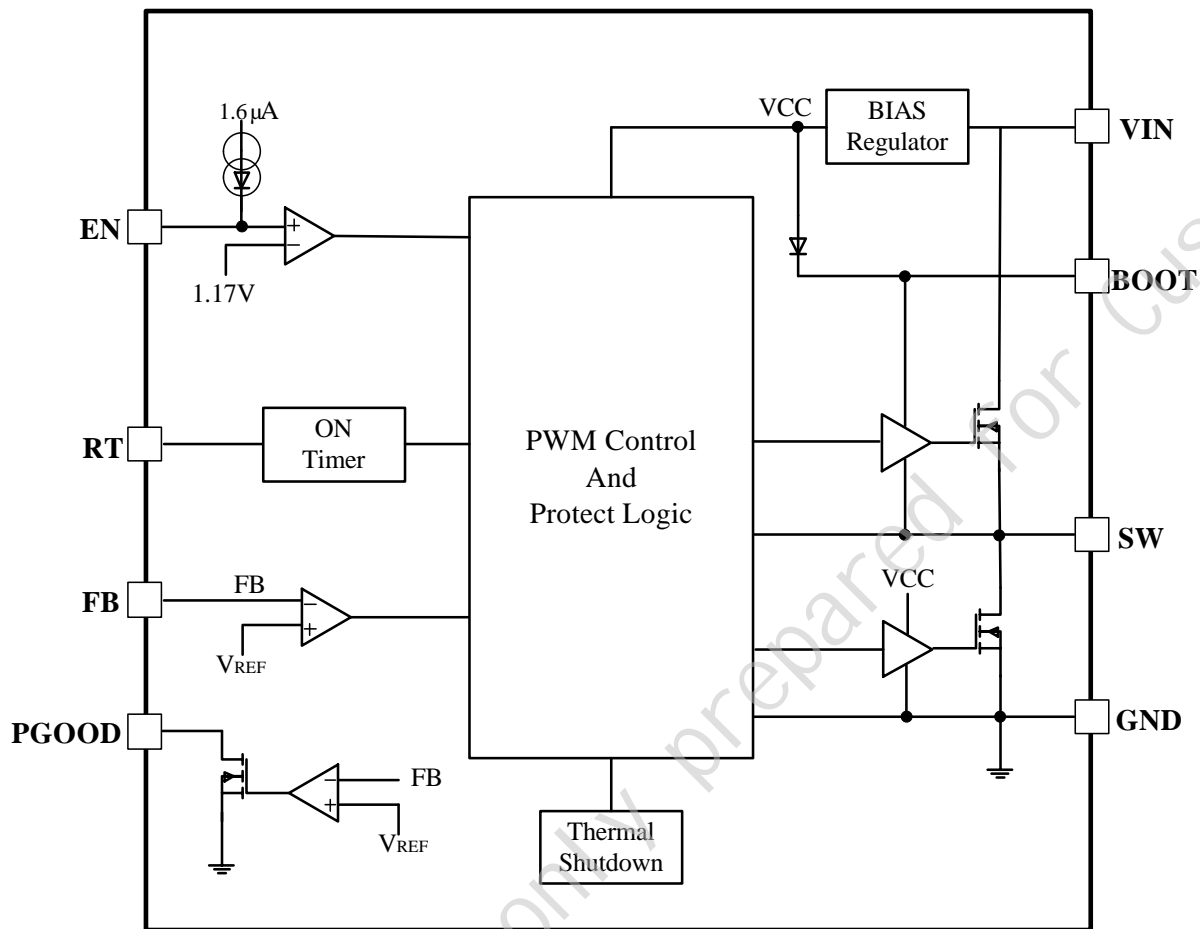

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process  
(2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process

## 9. Electrical Characteristics

$V_{IN}=24V$ ,  $V_{OUT}=5V$ ,  $L=47\mu H$ ,  $C_{OUT}=22\mu F$ . Typical values correspond to  $T_J=25^\circ C$ , Minimum and Maximum limits apply over the full  $-40^\circ C$  to  $125^\circ C$  junction temperature range unless otherwise indicated.

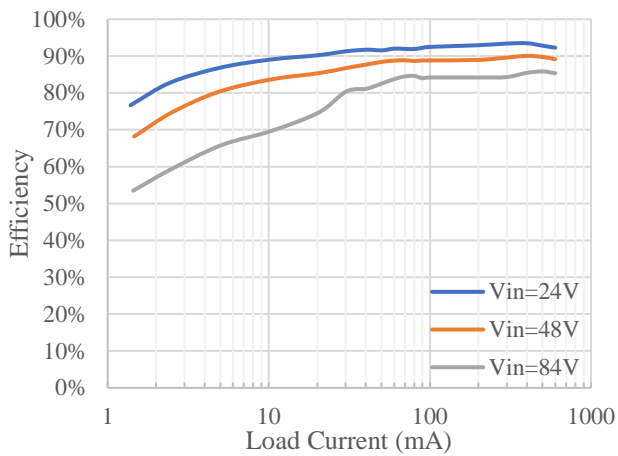

Parameter		Test Conditions	MIN	TYP	MAX	UNIT
Input Voltage						
V <sub>IN</sub>	Input Voltage		5		100	V
Supply Current						
I <sub>SHUTDOWN</sub>	Shutdown Current	V <sub>EN</sub> =0V		7.7		μA
I <sub>STANDBY</sub>	Standby Current	V <sub>EN</sub> =V <sub>IN</sub> , I <sub>OUT</sub> =0A,		65		μA
Feedback						
V <sub>REF</sub>	Feedback reference voltage		1.182	1.2	1.218	V
EN/UVLO						
V <sub>ENH</sub>	EN rising threshold	V <sub>IN</sub> =48V, I <sub>OUT</sub> =0.6A	1.0	1.17	1.24	V
I <sub>EN</sub>	Hysteresis Input Current	V <sub>IN</sub> =48V, I <sub>OUT</sub> =0.6A	-1	-1.6	-2.2	μA
Hysteresis						
PGOOD						
V <sub>PGH</sub>	FB rising threshold for PGOOD low to high	V <sub>FB</sub> rising	1.05	1.15	1.25	V
V <sub>PGL</sub>	FB falling threshold for PGOOD high to low	V <sub>FB</sub> falling	0.95	1.05	1.15	V
Frequency						
F <sub>SW</sub>	Programmable Switching Frequency Range	$F(kHz) = \frac{3.2 \times V_{OUT}(V)}{R_T(M\Omega)}$	100		1000	kHz
Timing						
t <sub>ON-MIN</sub>	Minimum on-time			50		ns
t <sub>OFF-MIN</sub>	Minimum off-time			270		ns
Power Switches						
R <sub>DS(ON)-HS</sub>	High-side MOSFET RDSON	Only tested at T <sub>J</sub> =25°C		0.75	0.8	Ω
R <sub>DS(ON)-LS</sub>	Low-side MOSFET RDSON	Only tested at T <sub>J</sub> =25°C		0.3	0.35	Ω
Current Limit						
I <sub>PEAK-HS</sub>	High-side MOSFET Peak Current limit	Only tested at T <sub>J</sub> =25°C	0.7		1.4	A
I <sub>VALLEY-LS</sub>	Low-side MOSFET Valley Current limit	Only tested at T <sub>J</sub> =25°C	0.5	0.6	0.7	A
Soft Start						
t <sub>SS</sub>	Soft-start time			3		ms
Thermal Shutdown						
T <sub>SD</sub>	Thermal Shutdown Threshold	T <sub>J</sub> rising		160		°C
T <sub>HYS</sub>	Thermal Shutdown Hysteresis			25		°C

## 12. Applications

### 12.1. Operation Overview

The MK9016 is a ultra-low  $I_Q$  synchronous buck converter. With very low  $R_{DS(ON)}$  MOSFETs, the MK9016 can achieve very high efficiency. This converter operates over a wide input voltage range from 4.5V to 100V delivering up to 0.6A DC load current. As adopting constant on-time (COT) mode, MK9016 can achieve fast transient responses for high voltage step down applications. Control loop compensation is not required for this regulator, reducing design time and external component count. And the pin arrangement is designed for a simple layout requiring only a few external components.

Because of high integration in the MK9016, the application circuit is very simple. Only the on-timer resistor  $R_T$ , the feedback resistors ( $R_{f1}$  and  $R_{f2}$ ), the BOOT capacitor  $C_{BOOT}$ , the feedforward capacitor  $C_{ff}$ , the input capacitor  $C_{IN}$ , the output capacitor  $C_{OUT}$  and the output inductor  $L$  need to be selected for the targeted applications.

### 12.2. Switching Frequency (RT)

The switch frequency of MK9016 is set by the on-time resistor  $R_T$ . As shown below, in 12VOUT application a 120kΩ resistor sets the switching frequency at 320kHz.

$$F_{sw}(kHz) = \frac{3.2 \times V_{OUT}(V)}{R_T(M\Omega)}$$

Note that the final switching frequency is not only affected by component tolerant but also  $t_{ON-MIN}$  and  $t_{OFF-MIN}$ .

### 12.3. Output Voltage Program

Choose  $R_{f1}$  and  $R_{f2}$  to program the output voltage. For target  $V_{OUT}$  setpoint, calculate  $R_{f1}$  and  $R_{f2}$  using below equation:

$$V_{OUT} = 1.2V \times \left(1 + \frac{R_{f1}}{R_{f2}}\right)$$

$R_{f1}$  in the range of 100kΩ to 500kΩ is recommended for most applications. Larger feedback resistors consume less DC current, which is important if light-load efficiency is critical. But too large resistors are not recommended as the feedback path would become more susceptible.

The feedforward capacitor  $C_{ff}$  is strongly recommended, which can improve the system stability and transient responses.

#### 12.4. Input Capacitor (C<sub>IN</sub>)

An input capacitor is necessary to limit the input ripple voltage while providing AC current to the buck converter at every switching cycle. The input ripple voltage  $\Delta V_{IN}$  at input capacitor is calculated as:

$$\Delta V_{IN} = \frac{I_{OUT} \times D \times (1 - D)}{F_{SW} \times C_{IN}} + I_{OUT} \times R_{ESR}$$

The capacitance of input capacitor is calculated as:

$$C_{IN} \geq \frac{I_{OUT} \times D \times (1 - D)}{F_{SW} \times (\Delta V_{IN} - I_{OUT} \times R_{ESR})}$$

To minimize the potential noise problem, a X5R or better grade capacitor with sufficient voltage rating is recommended. This capacitor should be close to the VIN and GND pins to minimize the loop area formed by C<sub>IN</sub> and VIN/GND pins. In this application, a 1μF low ESR ceramic capacitor is recommended.

#### 12.5. Output Inductor (L)

It is recommended to choose the ripple current of inductor between 30% to 50% of the rated load current I<sub>OUT</sub>(max) for most applications. The inductance is calculated as:

$$L = \frac{V_{OUT}}{F_{SW} \times \Delta I_L} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right)$$

And the peak current of inductor is calculated as:

$$I_L(\text{peak}) = I_{OUT}(\text{max}) + \frac{\Delta I_L}{2}$$

The saturation current rating of the inductor must greater than the I<sub>L</sub>(peak). An inductor whose saturation current is above the current limit setting of the MK9016 will be best choice. Note that inductor saturation current levels generally decrease as the inductor temperature increase.

#### 12.6. Output Capacitor (C<sub>OUT</sub>)

The output capacitor limits the capacitive voltage ripple at the converter output. This voltage ripple which is generated from the triangular inductor current ripple flowing into and out of the capacitor can be calculated as:

$$\Delta V_{OUT} = \frac{\Delta I_L}{8 \times F_{SW} \times C_{OUT}}$$

Above equation only take the steady state ripple into consideration. The transient requirements also must be taken into consideration when selecting the output capacitor. The X5R or better grade ceramic capacitor larger than 22μF is recommended.

## 12.7. Enable Operation

Input UVLO can be programmed by EN rising threshold. The UVLO turn-on voltage can be calculated as:

$$V_{UVLO} = \left(1 + \frac{R_{EN1}}{R_{EN2}}\right) \times V_{ENH}$$

$V_{ENH}$  is EN rising threshold voltage, typical is 1.17V.

The UVLO hysteresis is accomplished with an internal 1.6μA current source that is switched on or off into the impedance of the set-point divider. When the voltage at the EN pin exceeds the rising threshold, the current source is activated to quickly raise the voltage at the EN pin. The hysteresis can be calculated as:

$$V_{hys}(V) = R_{EN1} \times 1.6\mu A$$

## 12.8. Boot-strap capacitor

This capacitor provides the energy for high-side gate driver. A high quality 10nF ceramic capacitor connected between the BS pin and the SW pin is recommended. Also a RC series net can be used for slow down the turn-on speed of high side MOSFET.

## 12.9. Power Good (PGOOD)

MK9016 provides a PGOOD flag pin to indicate whether the output voltage is within the regulation level. PGOOD is an open-drain output that requires a pullup resistor to a DC source. The typical range of pullup resistance is about 10kΩ. When the FB voltage exceeds 96% of the reference, the internal switch will be turned off and PGOOD can be pulled high by the pullup resistor. If the FB voltage falls below 92% of the reference, the switch will be turned on and PGOOD is pulled low to indicate the output voltage is out of regulation.

## 13. Layout

### 13.1 Layout Guideline

To achieve high performance of the MK9016, the following layout tips must be followed.

- (1) At least one low-ESR ceramic bypass capacitor  $C_{IN}$  must be used. Place the  $C_{IN}$  as close as possible to the MK9016 VIN and GND pins.
- (2) Minimize the loop area formed by  $C_{IN}$  connections to VIN and GND pins.
- (3) Inductor must be placed close to the SW pin. Minimize the area of SW trace to avoid the potential noise problem.
- (4) Maximize the PCB area connecting to the GND pin and thermal pad. If it is allowed, a ground plane can be used as noise shielding and heat dissipation path.
- (5) Place the feedback resistors,  $R_{f1}$  and  $R_{f2}$ , close to the FB pin. Route the feedback  $V_{OUT}$  sense path away from noisy nodes such as the SW net.
- (6) The RT pin is sensitive to noise. The on-time set resistor  $R_T$  must be close to the device.
